				Oxycodone	90 mg	7:30	PO
P007	Ovarian Cancer	87	12:00	Escitalopram	10 mg	10:00	PO
				Fentanyl (patch)	18 mcg	22:00	Transdermal
P008	Lung Cancer	61	12:00	Dexamethasone	4 mg	9:00	PO
				Hydromorphone	9 mg	10:00	PO
P009	Congestive Heart Failure	77	15:00	Fentanyl (patch)	6 mcg	18:00	Transdermal
				Levothyroxine	25 mcg	10:00	PO
				Methylphenidat e	5 mg	10:00	PO

Supplementary Table S2a: Details of responsive hospice patient diagnosis and medications consumed on the day of each recording. Locations of cancer metastases are not included. Only medications that may affect cognitive function, and were administered before each recording, are included. Medications not included are those designed to treat the following: moderate pain relief (like acetaminophen and lidocaine), fungal infections, gout, blood clotting, hemorrhoids, constipation, skin diseases, nausea, and heartburn. Two patients (N007 and N009) were

prescribed sleep aids (Zopiclone 15mg PO, and Trazodone 50mg PO, respectively). These medications are not shown as it is unlikely the patients were still affected by the time of the recording based on medication half-lives. Times are listed using 24-hour clock.

List of abbreviations and acronyms: Approx. = Approximate, Med. = Medication, Admin. = Administration, PO = Per Os (medication taken orally), SUBCUT = Subcutaneously (medication administered by injection into the subcutaneous tissue).

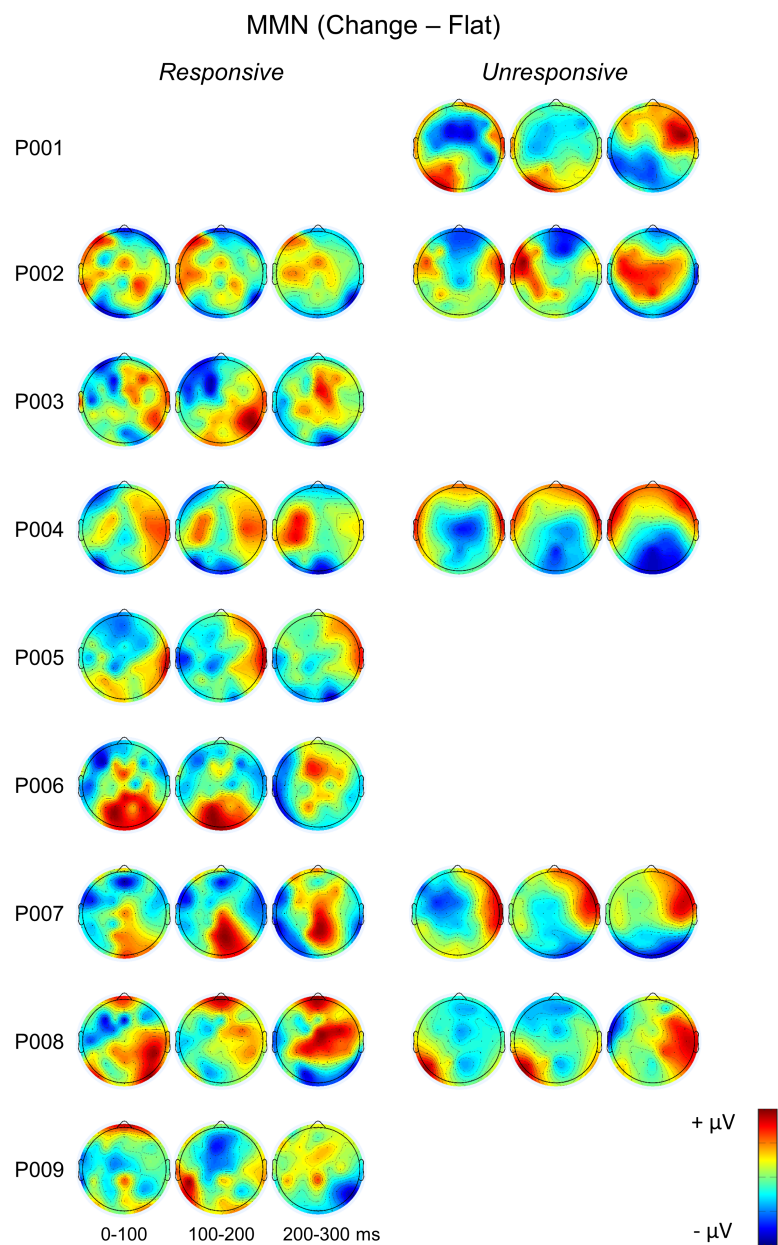

[illegible]

Supplementary Table S2b: Details of unresponsive hospice patient diagnosis and medications consumed on the day of each recording. Locations of cancer metastases are not included. Only medications that may affect cognitive function, and were administered before each recording, are included. Medications not included are those designed to treat the following: moderate pain relief (like acetaminophen and lidocaine), fungal infections, gout, blood clotting, hemorrhoids, constipation, skin diseases, nausea, and heartburn. For P001 a range of hydromorphone doses is reported because the specific dosage administered was not specified. P004 was able to take medications PO earlier in the day because they did not become unresponsive until the evening on the day of the recording. It was also verbally reported that P004 regained responsiveness sometime after the recording, but no written record of this is available to us. Times are listed using 24-hour clock.

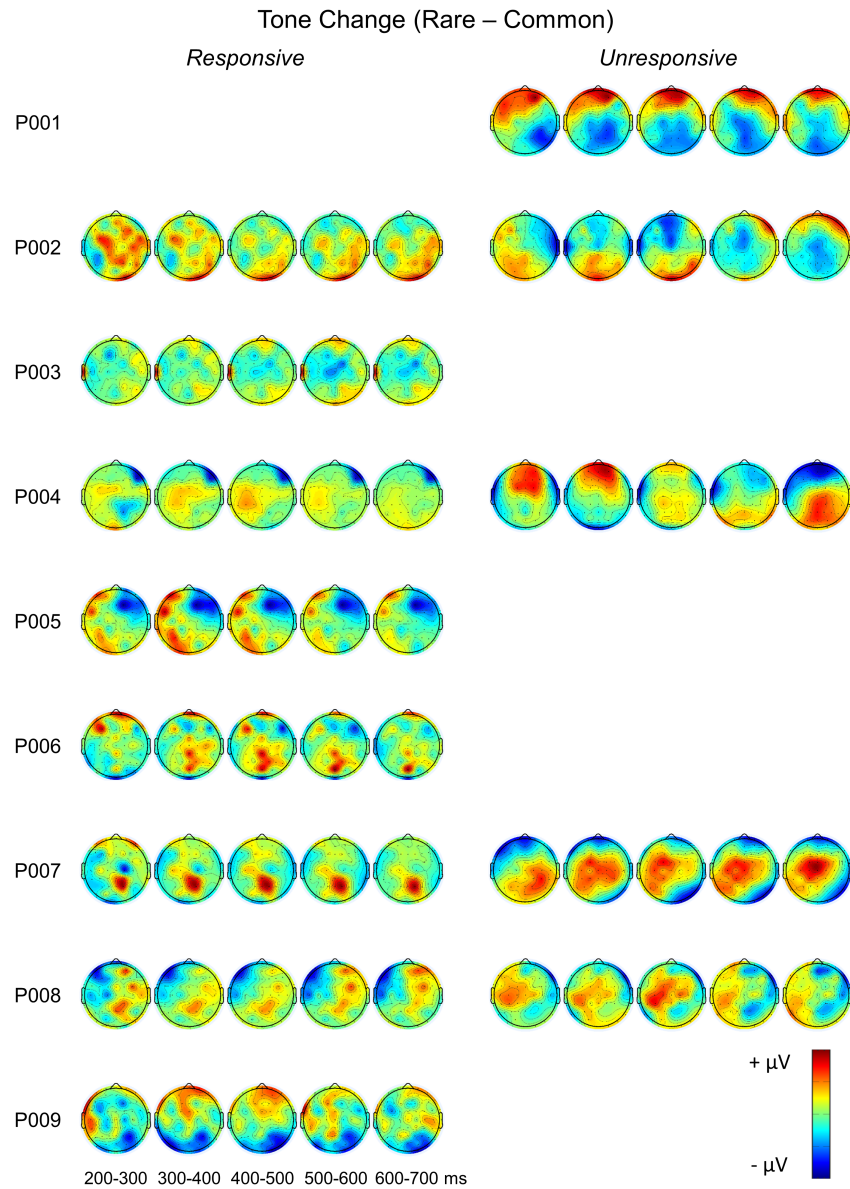

List of abbreviations and acronyms: Approx. = Approximate, Med. = Medication, Admin. = Administration, PO = Per Os (medication taken orally), SUBCUT = Subcutaneously (medication administered by injection into the subcutaneous tissue).

Drug Name	Description and Usage in a Hospice Context
clonazepam	A tranquilizer of the benzodiazepine class usually used for treating persistent anxiety.
dexamethasone	Corticosteroid used in controlling pain, nausea, raised intracranial pressure and lymphedema.
escitalopram	Antidepressant of the selective serotonin reuptake inhibitor class used to treat major depressive disorder or generalized anxiety disorder.
fentanyl	Opioid used to treat pain or shortness of breath due to advanced disease.
gabapentin	Anticonvulsant medication used to treat neuropathic pain.
glycopyrrolate	Anticholinergic used to reduce salivary production in deeply unconscious patients in order to avoid noisy respiration.
hydromorphone	Opioid used to treat pain or shortness of breath due to advanced disease
levetiracetam	Anticonvulsant medication used to treat seizures secondary to primary tumors of the brain and/or brain metastases.
levothyroxine sodium	Manufactured form of the thyroid hormone thyroxine used to treat thyroid hormone deficiency.
lorazepam	Benzodiazepine medication used to treat anxiety, insomnia, active seizures including status epilepticus,
methadone	Opioid used for pain management, usually when other opioids not tolerated or not effective.
methylphenidate	Stimulant medication used to counter sedation secondary to the use of opioids for pain management or shortness of breath.
oxycodone	Opioid used to treat pain or shortness of breath due to advanced disease.
trazodone	Antidepressant medication used in smaller doses for sleep and anxiety.
zopiclone	Hypnotic agent used in the treatment of insomnia with a similar side effect profile to benzodiazepines.

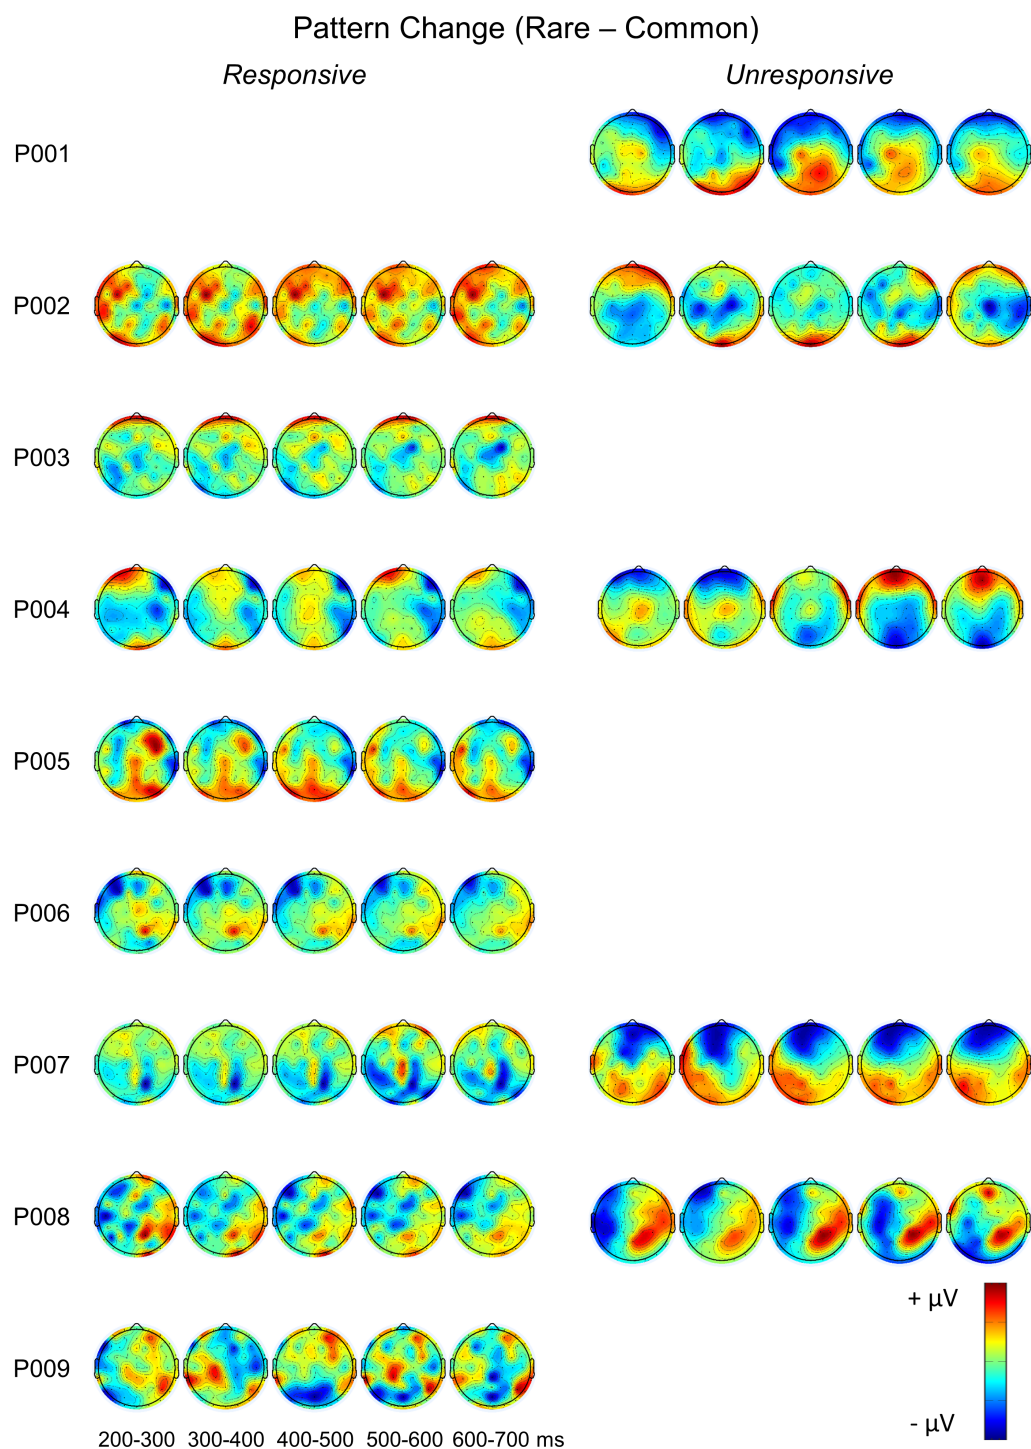

Supplementary Table S3: List of medications administered to hospice patients summarized in Tables S2a and S2b. List includes a description of each medication and its use in a hospice context

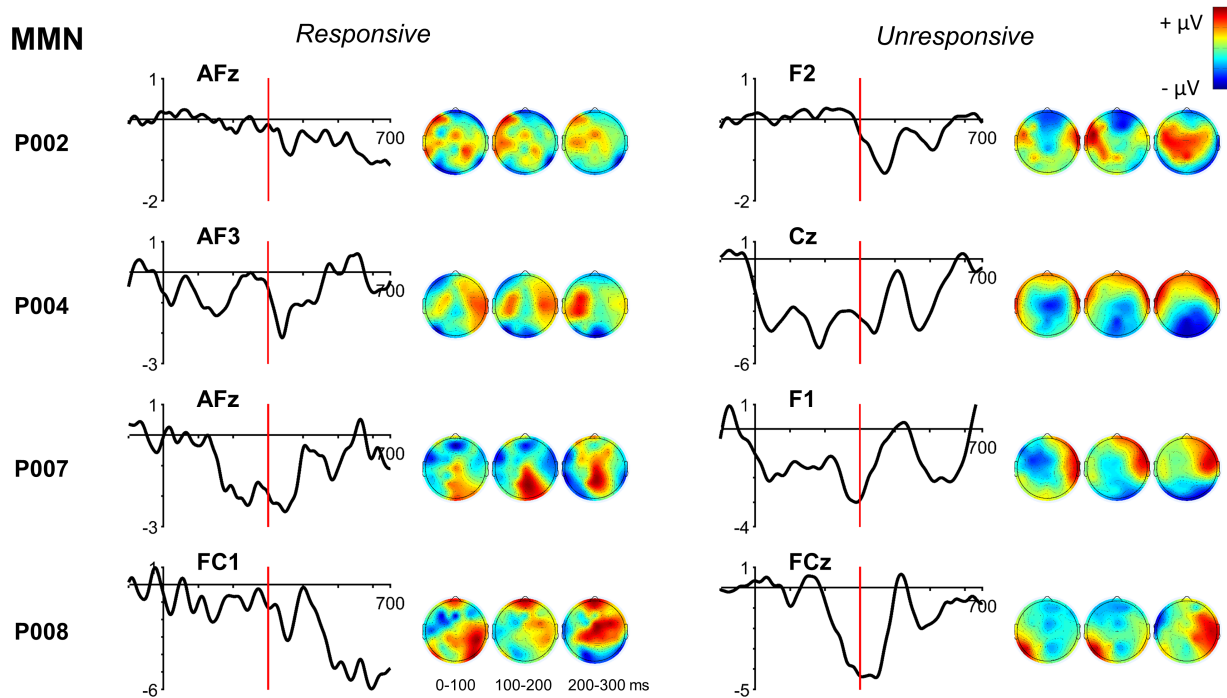

Supplementary Figure S1: Patient Scalp Maps (MMN). Topographic data were averaged across each 100ms time interval. Scalp map are scaled relative to their own min and max values.

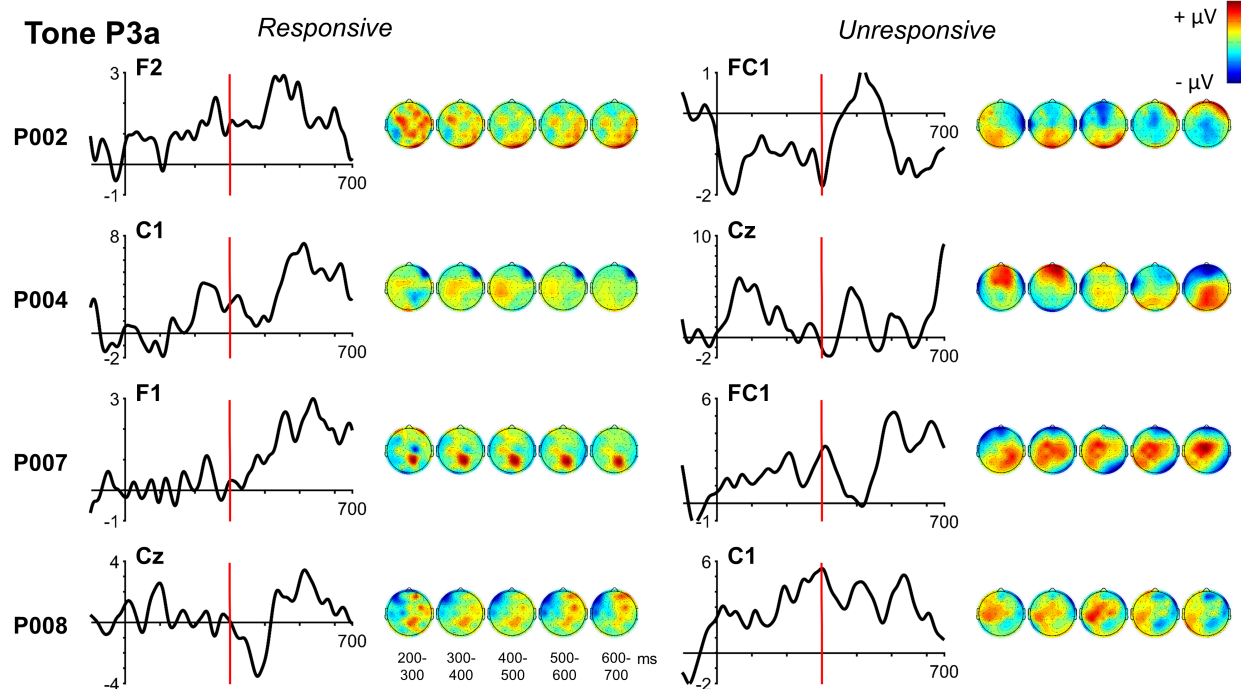

Supplementary Figure S2: Patient Scalp Maps (Tone Change). Topographic data were averaged across each 100ms time interval. Scalp map are scaled relative to their own min and max values.

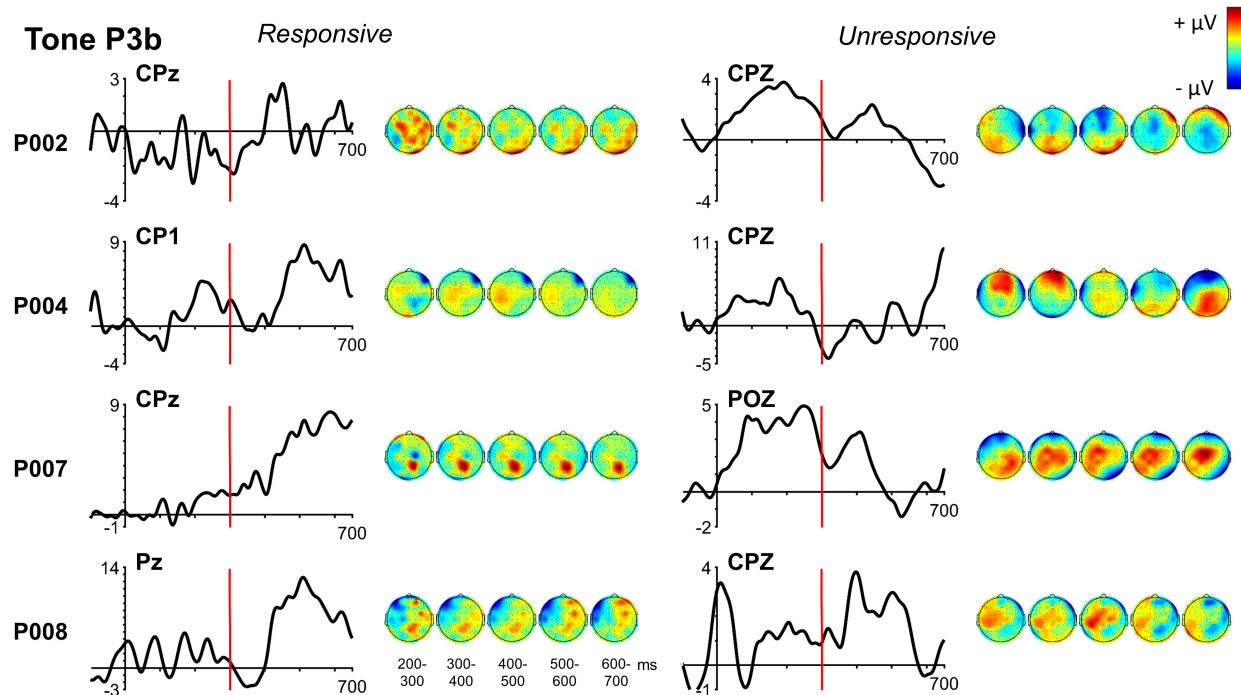

Supplementary Figure S3: Patient Scalp Maps (Pattern Change). Topographic data were averaged across each 100ms time interval. Scalp maps are scaled relative to their own min and max values.

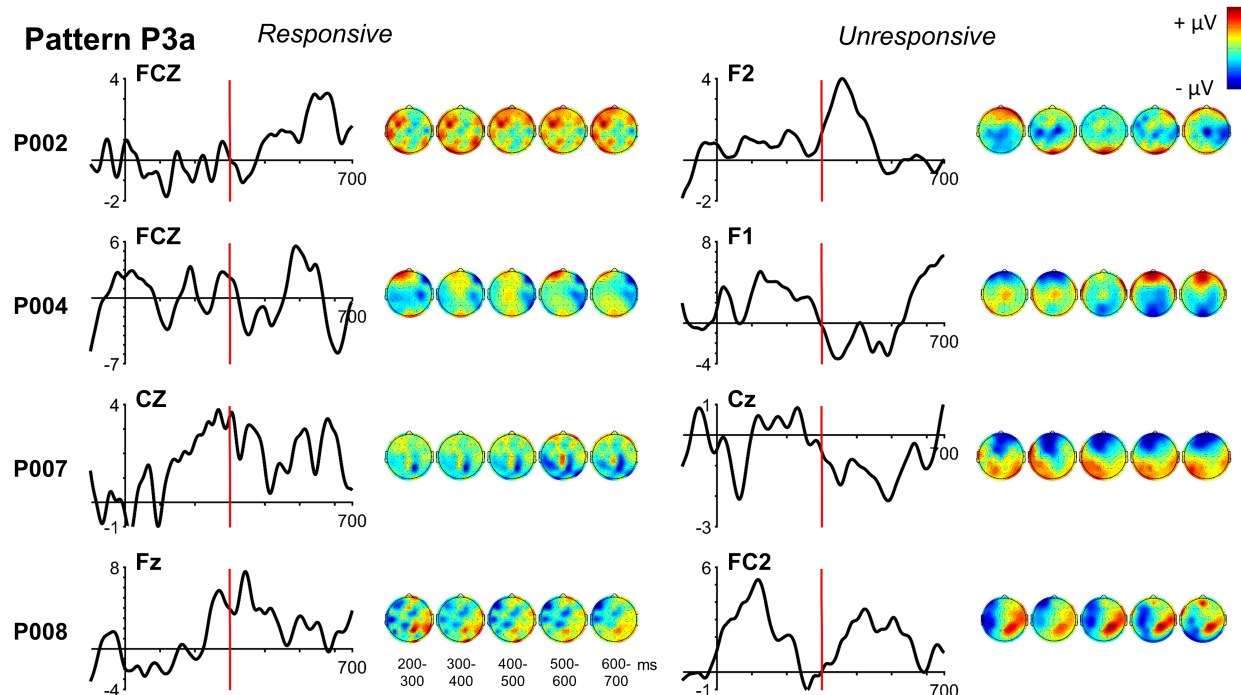

Supplementary Figure S4: Individual ERPs and Scalp Maps for the four patients who contributed data to both responsive and unresponsive sessions (MMN). Topographic data were averaged across each 100ms time interval. Scalp maps are scaled relative to their own minimum and maximum values. Only ERP difference waves from -800ms to 700ms from the last tone of the run are shown. Difference waves were baseline corrected from -800ms to -600ms from the last tone of the run (i.e. -200 to 0ms from the first tone of the run) and filtered at 10Hz . Black bars represent the onset of the first tone of the run (-600ms), red bars represent the onset of the last tone of the run (0ms).

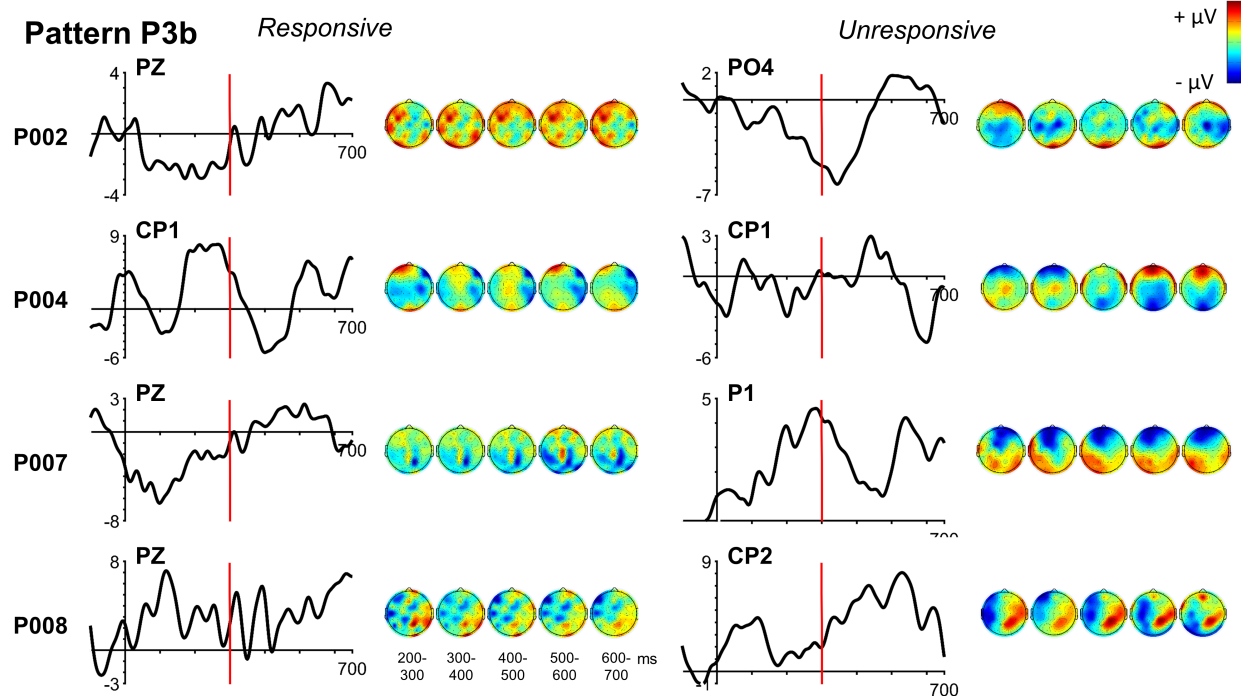

Supplementary Figure S5: Individual ERPs and Scalp Maps for the four patients who contributed data to both responsive and unresponsive sessions (Tone P3a). Topographic data were averaged across each 100ms time interval. Scalp maps are scaled relative to their own minimum and maximum values. Only ERP difference waves from – 800ms to 700ms from the last tone of the run are shown. Difference waves were baseline corrected from -800ms to -600ms from the last tone of the run (i.e. -200 to 0ms from the first tone of the run) and filtered at 10Hz. Black bars represent the onset of the first tone of the run (-600ms), red bars represent the onset of the last tone of the run (0ms).

Supplementary Figure S6: Individual ERPs and Scalp Maps for the four patients who contributed data to both responsive and unresponsive sessions (Tone P3b). Topographic data were averaged across each 100ms time interval. Scalp maps are scaled relative to their own minimum and maximum values. Only ERP difference waves from – 800ms to 700ms from the last tone of the run are shown. Difference waves were baseline corrected from -800ms to -600ms from the last tone of the run (i.e. -200 to 0ms from the first tone of the run) and filtered at 10Hz. Black bars represent the onset of the first tone of the run (-600ms), red bars represent the onset of the last tone of the run (0ms).

Supplementary Figure S7: Individual ERPs and Scalp Maps for the four patients who contributed data to both responsive and unresponsive sessions (Pattern P3a). Topographic data were averaged across each 100ms time interval. Scalp maps are scaled relative to their own minimum and maximum values. Only ERP difference waves from – 800ms to 700ms from the last tone of the run are shown. Difference waves were baseline corrected from -800ms to -600ms from the last tone of the run (i.e. -200 to 0ms from the first tone of the run) and filtered at 10Hz. Black bars represent the onset of the first tone of the run (-600ms), red bars represent the onset of the last tone of the run (0ms).

Supplementary Figure S8: Individual ERPs and Scalp Maps for the four patients who contributed data to both responsive and unresponsive sessions (Pattern P3b). Topographic data were averaged across each 100ms time interval. Scalp maps are scaled relative to their own minimum and maximum values. Only ERP difference waves from – 800ms to 700ms from the last tone of the run are shown. Difference waves were baseline corrected from –800ms to –600ms from the last tone of the run (i.e. –200 to 0ms from the first tone of the run) and filtered at 10Hz. Black bars represent the onset of the first tone of the run (–600ms), red bars represent the onset of the last tone of the run (0ms).
